

Helpful Configuration Scripts for the AR Router Series

Revision History

Author	Revision	Date	Modifications
ST	5.8.4	5 March 2001	<p>Ex 5.6; Correction to firewall rule 1 interface</p> <p>Ex 6.3; Firewall rule 2 and 3 removed; rule 4 renumbered to 2; rule 3 (internal 'nonat') added</p> <p>Ex 6.4; Heading adjusted; Note adjusted; Firewall rule 3 added</p> <p>Ex 6.5; Heading adjusted; Comments adjusted</p> <p>Ex 6.6; Two Gateways example added</p> <p>Ex 6.7; IPSec Testing notes added</p>
ST	5.8.5	19 March 2001	<p>Ex 6.3; Add 'isa' parameter to associate ipsec policy with specific isakmp policy. Create separate isakmp policies for remoffice and roaming VPN clients. Rename isakmp policies on vpn client.</p> <p>Added specific configuration for router B</p> <p>Ex 6.6; Add 'isa' parameter to associate ipsec policy with specific isakmp policy. Create separate isakmp policies for remoffice and roaming VPN clients. Rename isakmp policies on vpn client.</p>
ST	5.8.6	3 April 2001	<p>Ex 6.3; 'sendnotify' parameter added</p> <p>Ex 6.3.1, 6.4.1, 6.7; VPN Client interface defined as 'dialup'</p> <p>Ex 6.5; Removed ppp0 on site A. Modified ADSL pinhole details. Corrected eth0 address at site B.</p> <p>Ex 6.6 becomes Ex 6.7</p> <p>Ex 6.6 inserted; IPSec and Firewall through two NAT gateways (eg: ADSL)</p>
ST	5.8.7	5 April 2001	<p>Ex 5.6; Firewall DMZ modified to dual policy firewall</p> <p>Ex 6.2; 'remoteip' parameter added to firewall rule 1</p> <p>Ex 6.5, 6.7; 'sendnotify' parameter added</p> <p>Ex 6.6; Renamed IPS and ISA policy names; Use 'isa' parameter in IPS policy; Add Internet IPS policy</p> <p>Ex 6.8; Notes extended to give basic initial debugging modes.</p> <p>Ex 6.3, 6.4, 6.5; Secoff user and securedelay defined</p>

ATI are manufacturers of the AR router and are specialists in ISDN and secure networking devices. More detailed information on the AR products is available on ATI's World Wide Web sites ; www.alliedtelesyn.com

6.4.1.	IPSec Client option for Example 6.4.....	34
6.5.	IPSec & ISAKMP (with L2TP) and Firewall router, behind NAT device (eg:ADSL)	35
6.6.	IPSec and Firewall through two NAT gateways (eg: ADSL).....	37
6.7.	Two Gateways; Firewall with IPSec and ISAKMP to VPN Client & Remote Office.....	39
6.8.	Notes on IPSec Testing and Verification	41

1. Quick Command Reference

1.1. Configurations

Task	Command
Sho the log	Sho log
View the current release and patch	Sho install
Sho the system Information	Sho sys
Save the current configuration	Create config=<config>.cfg
Change the boot configuration file	Set conf=<config>.cfg
What is the current configuration file	Sho conf
Sho the current RAM configuration	Sho conf dyn Sho conf dyn=<sub section>

1.2. Filing, Reboots, and Feature Licences

Task	Command
Sho file contents in FLASH or NVS	Sho fi=<file.ext>
Sho files	Sho fi
To Edit a file	Edit <file.ext>
Warm boot the router	Restart reboot
Quick boot (for applying new configurations)	Restart router
Enable a new feature licence	Enable feature=<feature> pass=<password>

1.3. Command Actions

To config	To Remove from Configuration	To view and modify
Add	Delete	Sho
Create	Destroy	Set
Activate	Deactivate	Reset
Enable	Disable	Purge

1.4. Upgrade Process

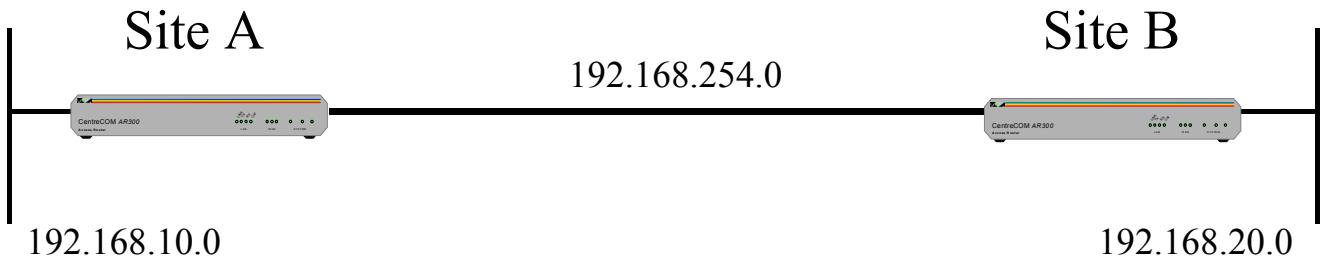

Upgrade process	Commands
Make space, delete the old files	Del fi=<oldfile.ext>
Load files	Load fi=<file.rez> dest=flash serv=<server ip> Load fi=<file.paz> dest=flash serv=<server ip> Load fi=<file.hlp> dest=flash serv=<server ip>
Apply a Help file	Set help=<help>.hlp
Save the config	Create conf=<current config>
Enable the release licence	Enable rel=<release.rez> num=<release> pass=<password>
Set the current release and patch file	Set inst=pref rel=<release.rez> pat=<patch.paz>
Warm boot the router	Restart reboot

1.5. Generating an Encryption Key

Task	Command
Add security level user	Add user=sec0ff pass=sec0ff priv=security
Keep security officer access for 10 Minutes	Set user securedelay=600
Turn on Security	Enable system security
Create the Manual or SA key at one end Or Create the ISAKMP key	At router 'A'>Create enco key=1 type=des random Or At router 'A'>Create enco key=1 type=gen random
View the key and	At router 'A'>Sho enco key=1 (tip: copy and paste this key to router B)
Enter the Manual/SA key at the other end Or Enter the ISAKMP key at the other end	At router 'B'>Create enco key=1 type=des val=<router 'A' key> Or At router 'B'>Create enco key=1 type=gen val=<router 'A' key>
Allow remote Security officer access and Specify remote IP address ranges	Enable user rso Add user rso ip=<remote access ip> mask=<mask>

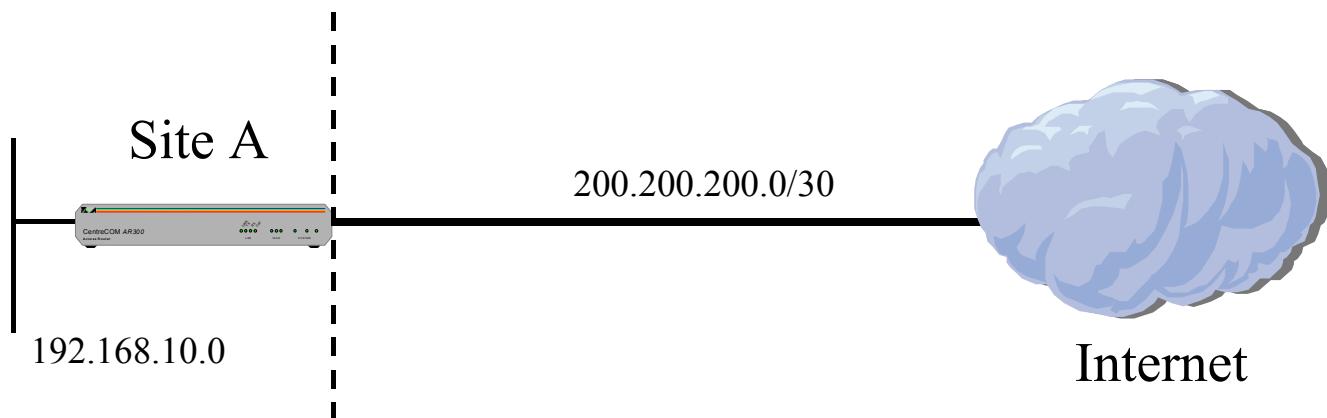

2. PPP over ISDN and DDS

2.1. PPP over DDS for a Private network

Router A	Router B
<pre> # # PPP Configuration # create ppp=0 over=syn0 # # IP Configuration # enable ip add ip int=eth0 ip=192.168.10.1 add ip int=ppp0 ip=192.168.254.1 add ip route=0.0.0.0 next=0.0.0.0 int=ppp0 </pre>	<pre> # # PPP Configuration # create ppp=0 over=syn0 # # IP Configuration # enable ip add ip int=eth0 ip=192.168.20.1 add ip int=ppp0 ip=192.168.254.2 add ip route=0.0.0.0 next=0.0.0.0 int=ppp0 </pre>

2.2. PPP over DDS for Internet Access

Private NAT Public

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP *Echo Request* and *Echo Reply* messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

Router A

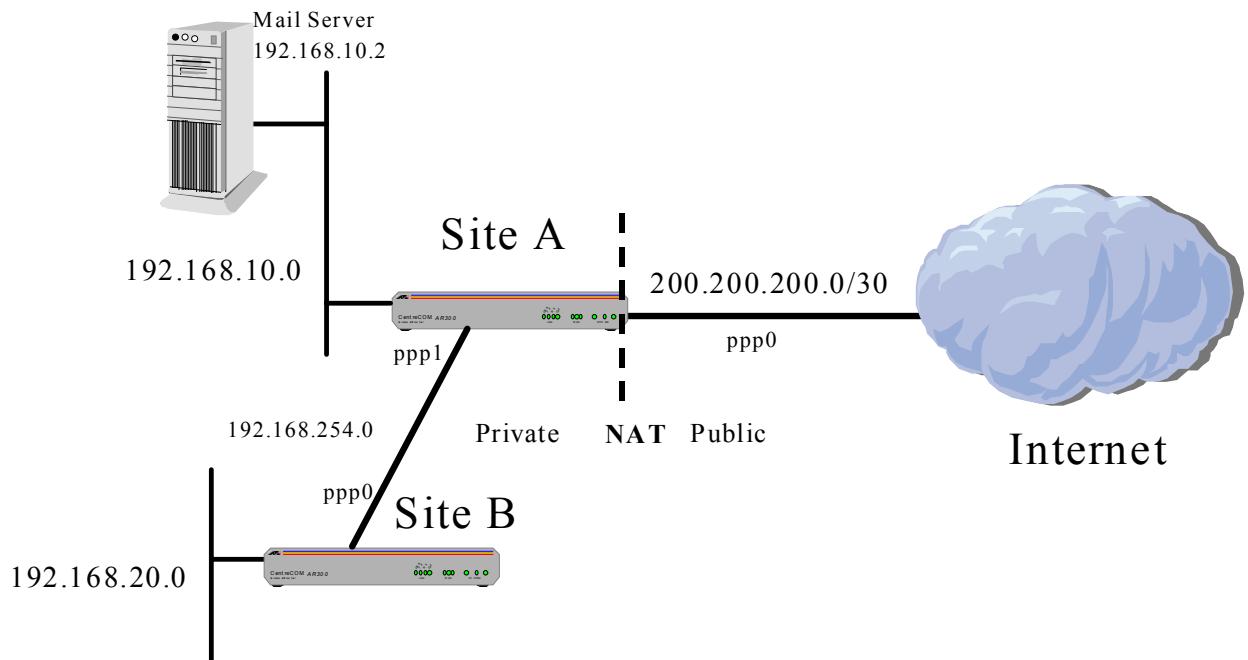

```

#
# PPP Configuration
#
create ppp=0 over=syn0

#
# IP Configuration
#
enable ip
add ip int=eth0 ip=192.168.10.1
add ip int=ppp0 ip=200.200.200.1 mask=255.255.255.252
add ip route=0.0.0.0 next=0.0.0.0 int=ppp0
enable ip nat
enable ip nat log=all
add ip nat ip=192.168.10.0 mask=255.255.255.0 gblint=ppp0

```

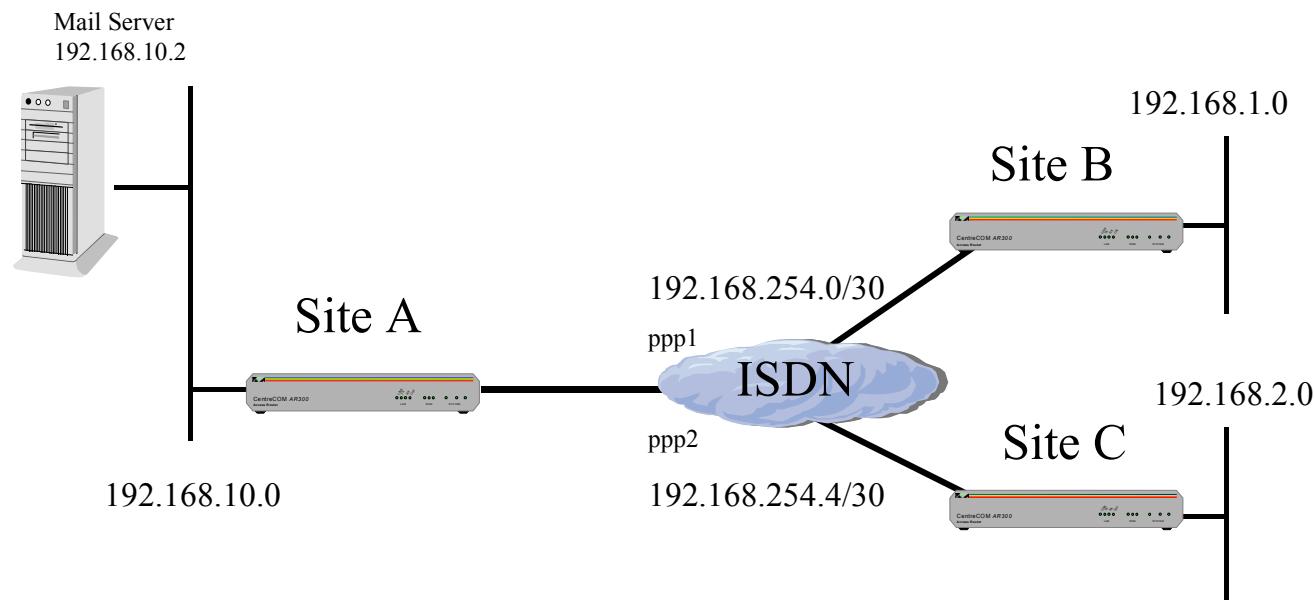

2.3. PPP over DDS for Internet (NAT to SMTP Server) and Private networks

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP Echo Request and Echo Reply messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

Router A	Router B
<pre> # # PPP Configuration # create ppp=0 over=syn0 create ppp=1 over=syn1 # # IP Configuration # enable ip add ip int=eth0 ip=192.168.10.1 add ip int=ppp1 ip=192.168.254.1 add ip int=ppp0 ip=200.200.200.1 mask=255.255.255.252 add ip route=0.0.0.0 next=0.0.0.0 int=ppp0 add ip route=192.168.20.0 next=0.0.0.0 int=ppp1 enable ip nat enable ip nat log=all add ip nat ip=192.168.0.0 mask=255.255.0.0 gblip=200.200.200.1 add ip nat ip=192.168.10.2 mask=255.255.255.255 port=smtp gblip=200.200.200.1 gblport=smtp proto=tcp </pre>	<pre> # # PPP Configuration # create ppp=0 over=syn0 # # IP Configuration # enable ip add ip int=eth0 ip=192.168.20.1 add ip int=ppp0 ip=192.168.254.2 add ip route=0.0.0.0 next=0.0.0.0 int=ppp0 </pre>

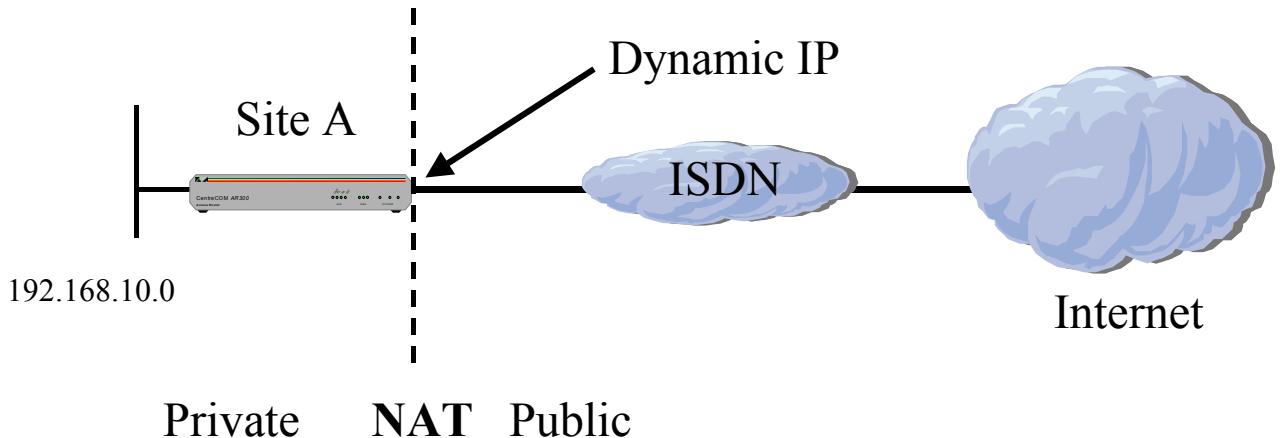

2.4. PPP over ISDN Private network

Router A	Router B
<pre> # System Configuration # set sys territory=<countrycode> # # ISDN Configuration # add isdn call=siteb num=12345 prec=in searchsub=local outsub=local add isdn call=sitere num=34567 prec=in searchsub=local outsub=local # # PPP Configuration # create ppp=1 over=isdn-siteb idle=60 create ppp=2 over=isdn-sitere idle=60 # # IP Configuration # enable ip add ip int=eth0 ip=192.168.10.1 add ip int=ppp1 ip=192.168.254.1 mask=255.255.255.252 add ip int=ppp2 ip=192.168.254.5 mask=255.255.255.252 add ip route=192.168.1.0 next=0.0.0.0 int=ppp1 add ip route=192.168.2.0 next=0.0.0.0 int=ppp2 </pre>	<pre> # System Configuration # set sys territory=<countrycode> # # ISDN Configuration # add isdn call=siteb num=54321 prec=out searchsub=local outsub=local # # PPP Configuration # create ppp=0 over=isdn-siteb idle=60 # # IP Configuration # enable ip add ip int=eth0 ip=192.168.1.1 add ip int=ppp0 ip=192.168.254.2 add ip route=0.0.0.0 next=0.0.0.0 int=ppp0 </pre>

	<p>Router C</p> <p>Same as router B with the following exceptions</p> <ol style="list-style-type: none"> 1) Replace all occurrences of "siteb" with "sitec" 2) Change the ip address of ppp0 and eth0 appropriately
--	--

2.5. PPP over ISDN Internet Access

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP *Echo Request* and *Echo Reply* messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

Router A

```

#
# System Configuration
set sys territory=<countrycode>
#
# ISDN Configuration
add isdn call=internet num=12345 prec=out
#
# PPP Configuration
# Note: 2nd B channel on demand
create ppp=0 over=isdn-internet idle=60 bap=off ipreq=on user=<username> pass=<password>
add ppp=0 over=isdn-internet type=demand
#
# IP Configuration
enable ip
enable ip rem
add ip int=eth0 ip=192.168.10.1
add ip int=ppp0 ip=0.0.0.0
add ip route=0.0.0.0 next=0.0.0.0 int=ppp0
enable ip nat
enable ip nat log=all
add ip nat ip=192.168.10.0 mask=255.255.255.0 gblint=ppp0

```

2.5.1. Example 2.5 with 2 B channels always up

Note: Some ISDN providers and /or ISP providers charge per minute and this option may not be affordable. This alternative is intended where an affordable fixed monthly charge account has been offered by ISDN and ISP providers.

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP *Echo Request* and *Echo Reply* messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

ISDN & PPP Configuration modifications for 2 B channels always up

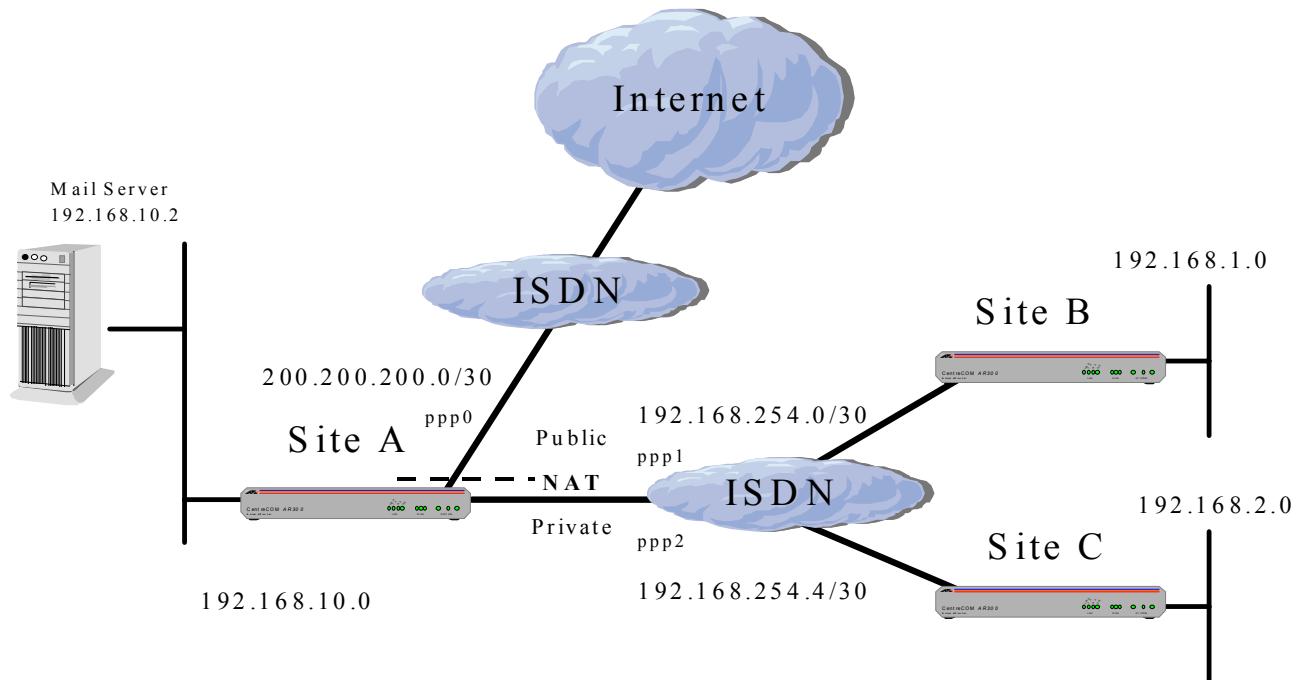

```
#  
# ISDN Configuration  
#  
add isdn call=internet num=12345 prec=out keepup=on  
#  
# PPP Configuration  
# Note: No idle parameter, user and password required if going into an ISP  
create ppp=0 over=isdn-internet num=2 bap=off [user=<username> password=<password>]
```

2.5.2. Example 2.5 with Cisco's at the ISP

PPP Configuration modifications for Cisco at the ISP

```
#  
# PPP Configuration  
# Note: 2nd B channel on demand  
create ppp=0 over=isdn-internet idle=60 bap=off lqr=off echo=on user=<user name> pass=<password>  
add ppp=0 over=isdn-internet type=demand
```

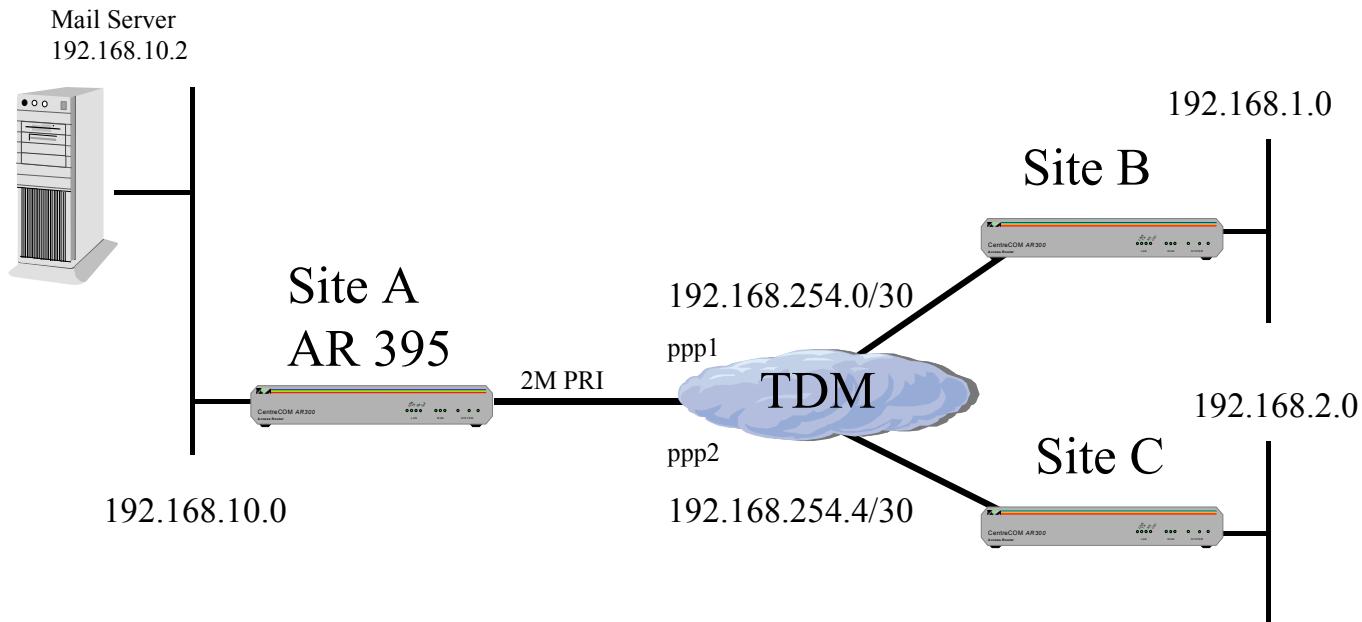

2.6. PPP over ISDN Internet and Private networks

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP Echo Request and Echo Reply messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

Router A	Router A (Continued)
<pre> # System Configuration # set sys territory=<countrycode> # # ISDN Configuration # add isdn call=internet num=666 prec=out add isdn call=siteb num=12345 prec=in searchsub=local outsub=local add isdn call=sitere num=34567 prec=in searchsub=local outsub=local # # PPP Configuration # create ppp=0 over=isdn-internet idle=60 bap=off user=<username> pass=<password> create ppp=1 over=isdn-siteb idle=60 create ppp=2 over=isdn-sitere idle=60 </pre>	<pre> # IP Configuration # enable ip add ip int=eth0 ip=192.168.10.1 add ip int=ppp0 ip=200.200.200.1 add ip int=ppp1 ip=192.168.254.1 mask=255.255.255.252 add ip int=ppp2 ip=192.168.254.5 mask=255.255.255.252 add ip route=192.168.1.0 next=0.0.0.0 int=ppp1 add ip route=192.168.2.0 next=0.0.0.0 int=ppp2 add ip route=0.0.0.0 next=0.0.0.0 int=ppp0 enable ip nat enable ip nat log=all # Note: NAT adds local subnets for all 3 sites add ip nat ip=192.168.10.0 mask=255.255.255.0 gblip=200.200.200.1 add ip nat ip=192.168.1.0 mask=255.255.255.0 gblip=200.200.200.1 add ip nat ip=192.168.2.0 mask=255.255.255.0 gblip=200.200.200.1 add ip nat ip=192.168.10.2 mask=255.255.255.255 port=smtp gblip=200.200.200.1 gblport=smtp proto=tcp </pre>
Router B and C configured as in example 2.4	

3. Time Division Multiplexing (TDM)

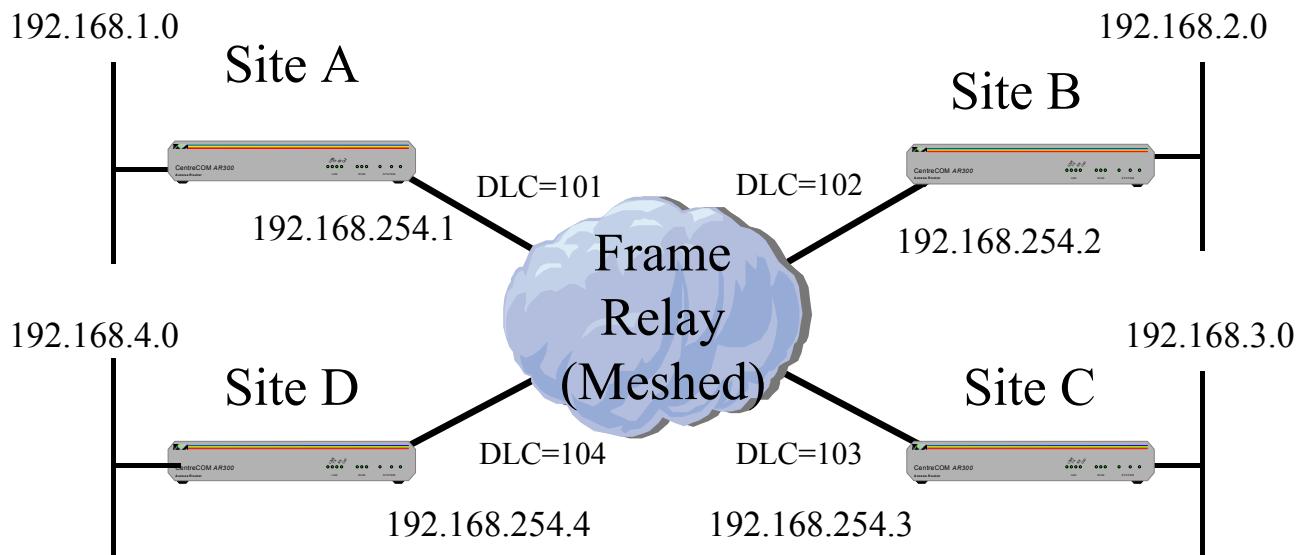

Router A	Router A (Continued)
<pre> # # PRI configuration # Note:"CRC" mode may need to be set to "off" or # "checking" for the link to become active # depending on the Telco configuration # Note : RJ 45 Pinouts for PRI devices aren't # standardized, check your NTU if using RJ 45. # termination set pri=0 mode=tdm set pri=0 crc=reporting # # TDM configuration # create tdm group=site_b interface=pri0 slots=1 create tdm group=site_c interface=pri0 slots=6-7 # # PPP Configuration # create ppp=1 over=tdm-site_b idle=60 comp=on create ppp=2 over=tdm-site_c idle=60 comp=on </pre>	<pre> # # IP Configuration # enable ip add ip int=eth0 ip=192.168.10.1 add ip int=ppp1 ip=192.168.254.1 mask=255.255.255.252 add ip int=ppp2 ip=192.168.254.5 mask=255.255.255.252 add ip route=192.168.1.0 next=0.0.0.0 int=ppp1 add ip route=192.168.2.0 next=0.0.0.0 int=ppp2 Router B # # PPP Configuration # create ppp=0 over=syn0 # # IP Configuration # Note: Router C change eth and ppp IP address enable ip add ip int=eth0 ip=192.168.1.1 add ip int=ppp0 ip=192.168.254.2 add ip route=0.0.0.0 next=0.0.0.0 int=ppp0 </pre>

4. Frame Relay

4.1. Standard Frame Relay for LMI REV 1

(Sometimes referred to as "cisco" LMI type)

Router A

```

#
# Frame Relay Configuration
#
# Note: By default LMI is set to "LMIrev1" which is the same as "cisco" LMI type.
create fr=0 over=syn0
#
# IP Configuration
#
enable ip
add ip int=fr0 ip=192.168.254.1
add ip int=eth0 ip=192.168.1.1
add ip route=192.168.2.0 next=0.0.0.0 mask=255.255.255.0 int=fr0 dlc=102
add ip route=192.168.3.0 next=0.0.0.0 mask=255.255.255.0 int=fr0 dlc=103
add ip route=192.168.4.0 next=0.0.0.0 mask=255.255.255.0 int=fr0 dlc=104

```

Router B, C, and D must have the ip addresses and routes changed appropriately

To use RIP instead, remove the static routes and add the following lines

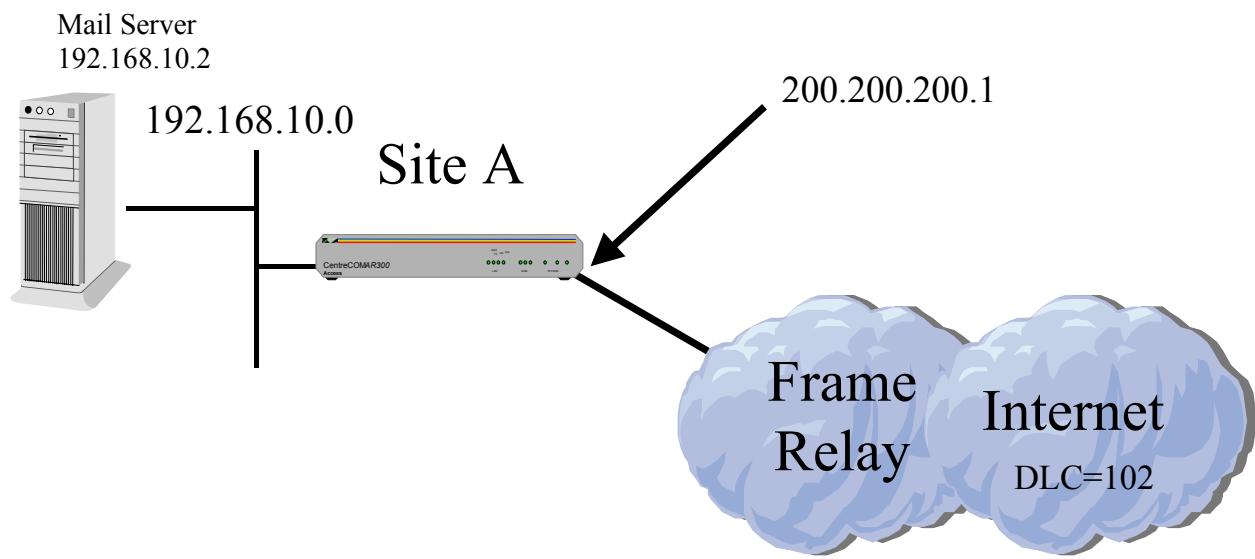

```

Add ip rip int=fr0 dlc=102
Add ip rip int=fr0 dlc=103
Add ip rip int=fr0 dlc=104

```

(LMI Rev 1 is default LMI for Telecom New Zealand)

4.2. Standard Frame Relay ISP Access

Router A

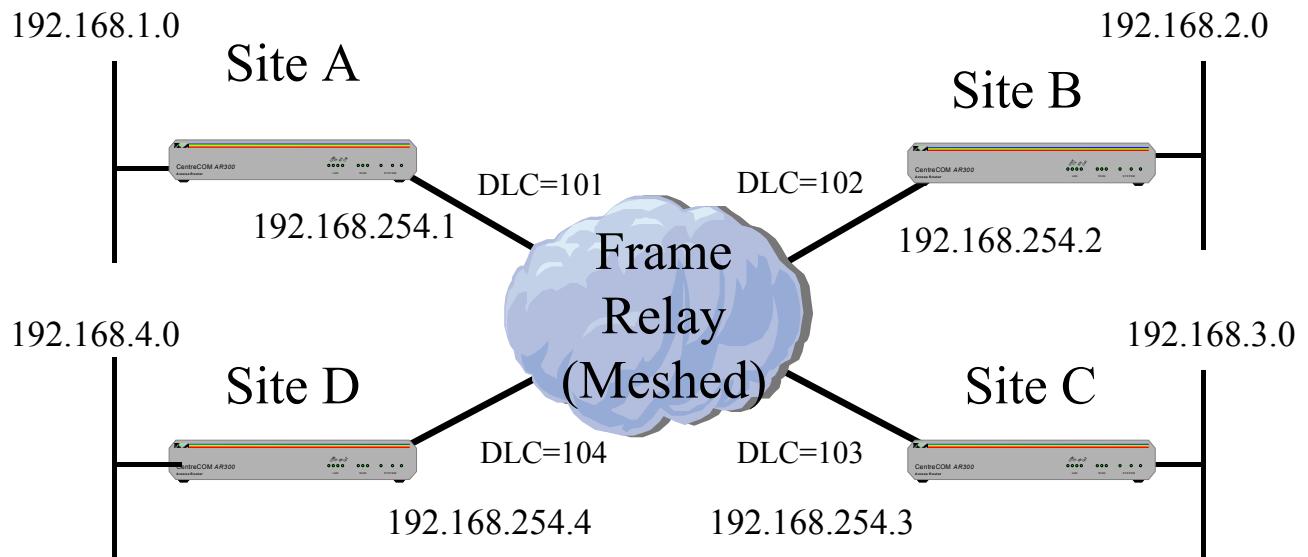

```

#
# Frame Relay Configuration
# Note: By default LMI is set to "LMIrev1" which is the same as "cisco" LMI type.
create fr=0 over=syn0
#
# IP Configuration
#
enable ip
add ip int=fr0 ip=200.200.200.1 mask=255.255.255.252
add ip int=eth0 ip=192.168.10.1
add ip route=0.0.0.0 next=0.0.0.0 mask=0.0.0.0 int=fr0 dlc=102
enable ip nat
enable ip nat log=all
add ip nat ip=192.168.10.0 mask=255.255.255.0 gblip=200.200.200.1
add ip nat ip=192.168.10.2 mask=255.255.255.255 port=smtp gblip=200.200.200.1 gblport=smtp
proto=tcp

```

4.3. Standard Frame Relay for LMI AnnexD

(Sometimes referred to as "ANSI" LMI type)

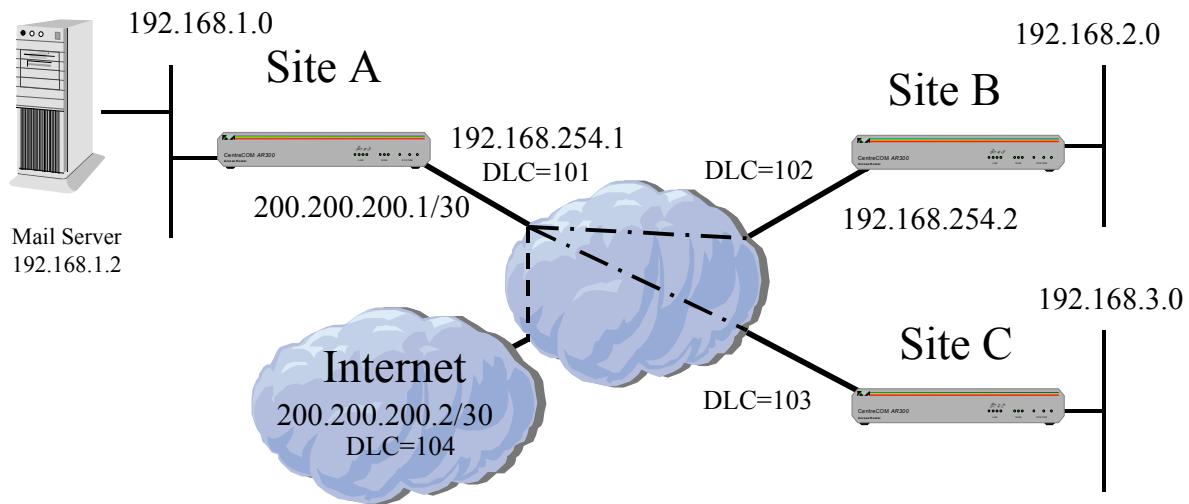

Router A

```

#
# Frame LMI set for annexd
create fr=0 over=syn0 lmi=annexd
#
# IP Configuration
#
enable ip
add ip int=eth0 ip=192.168.1.1
add ip int=fr0 ip=192.168.254.1
add ip route=192.168.2.0 next=192.168.254.2 mask=255.255.255.0 int=fr0 dlc=102
add ip route=192.168.3.0 next=192.168.254.3 mask=255.255.255.0 int=fr0 dlc=103
add ip route=192.168.4.0 next=192.168.254.4 mask=255.255.255.0 int=fr0 dlc=104
  
```

Router B, C, and D must have the ip addresses and routes changed appropriately

4.4. Logical interfacing to Frame Relay, Internet connection via ISP with Private Network

Router A

```

#
# Frame Relay Configuration
# Note: By default LMI is set to "LMIrev1" which is the same as "cisco" LMI type.
create fr=0 over=syn0
add fr=0 li=1 type=ptp
add fr=0 li=2
set fr=0 dlc=102 li=2
set fr=0 dlc=103 li=2
set fr=0 dlc=104 li=1
#
# IP Configuration
#
enable ip
add ip int=fr0.2 ip=192.168.254.1
add ip int=fr0.1 ip=200.200.200.1 mask=255.255.255.252
add ip int=eth0 ip=192.168.1.1
add ip route=0.0.0.0 next=0.0.0.0 mask=0.0.0.0 int=fr0.1 dlc=104
add ip route=192.168.2.0 next=192.168.254.2 mask=255.255.255.0 int=fr0.2 dlc=102
add ip route=192.168.3.0 next=192.168.254.3 mask=255.255.255.0 int=fr0.2 dlc=103
enable ip nat
enable ip nat log=all
add ip nat ip=192.168.0.0 mask=255.255.0.0 gblip=200.200.200.1
add ip nat ip=192.168.1.2 mask=255.255.255 port=smtp gblip=200.200.200.1 gblport=smtp
proto=tcp

```

Router B and C would remain configured as in example 4.1 (no FRLIs)

4.4.1. OSPF on the private network, 4.4 continued

Router A (First remove the 2 static routes to the private network sites, leave default route

```
#  
# Frame Relay Configuration  
# Note: By default LMI is set to "LMIrev1" which is the same as "cisco" LMI type.  
create fr=0 over=syn0  
add fr=0 li=1 type=ptp  
add fr=0 li=2 type=ptp  
add fr=0 li=3 type=ptp  
set fr=0 dlc=102 li=2  
set fr=0 dlc=103 li=3  
set fr=0 dlc=104 li=1  
#  
# IP Configuration  
#  
enable ip  
add ip int=fr0.2 ip=192.168.254.1 mask=255.255.255.252  
add ip int=fr0.3 ip=192.168.254.5 mask=255.255.255.252  
add ip int=fr0.1 ip=200.200.200.1 mask=255.255.255.252  
add ip int=eth0 ip=192.168.1.1  
add ip route=0.0.0.0 next=0.0.0.0 mask=0.0.0.0 int=fr0.1 dlc=104  
enable ip nat  
enable ip nat log=all  
add ip nat ip=192.168.0.0 mask=255.255.0.0 gblip=200.200.200.1  
add ip nat ip=192.168.1.2 mask=255.255.255.255 port=smtp gblip=200.200.200.1 gblport=smtp proto=tcp  
#  
# OSPF Configuration  
#  
set ospf routerid=192.168.254.1 asexternal=on  
add ospf area=backbone stubarea=off summary=send  
add ospf range=192.168.254.0 area=backbone mask=255.255.255.0  
add ospf interface=fr0.2 area=backbone  
add ospf interface=fr0.3 area=backbone  
enable ospf
```

Router B

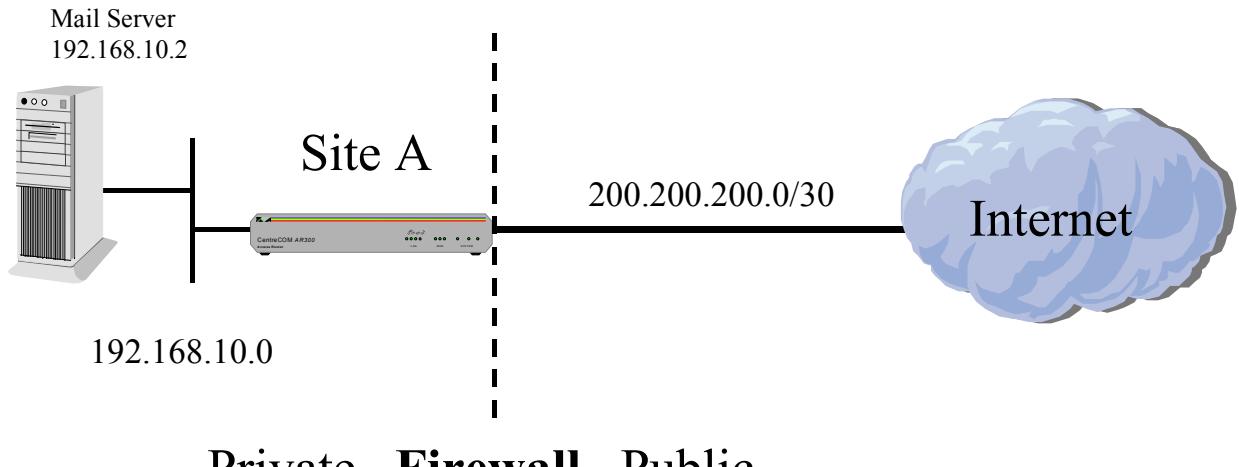

```
#  
# Frame Relay Configuration  
# Note: By default LMI is set to "LMIrev1" which is the same as "cisco" LMI type.  
create fr=0 over=syn0  
add fr=0 li=1 type=ptp  
set fr=0 dlc=101 li=1  
#  
# IP Configuration  
#  
enable ip  
add ip int=fr0.1 ip=192.168.254.2 mask=255.255.255.252  
add ip int=eth0 ip=192.168.2.1  
#  
# OSPF Configuration  
#

5. Firewall Configs

5.1. Simple Firewall over PPP with internal mail server

Private Firewall Public

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP *Echo Request* and *Echo Reply* messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

Router A

```

#
# PPP Configuration
#
create ppp=0 over=syn0
#
# IP Configuration
#
enable ip
add ip int=ppp0 ip=200.200.200.1 mask=255.255.255.252
add ip int=eth0 ip=192.168.10.1
add ip route=0.0.0.0 next=0.0.0.0 mask=0.0.0.0 int=ppp0
#
# Firewall Configuration
# To enable outgoing ping see example 5.1.1
enable firewall
enable firewall notify=port,manager port=0
create firewall policy="main"
add firewall policy="main" int=eth0 type=private
add firewall policy="main" int=ppp0 type=public
add firewall poli="main" nat=enforced int=eth0 gblin=ppp0 gblip=200.200.200.1
add firewall poli="main" ru=1 ac=allo int=ppp0 prot=tcp po=25 ip=192.168.10.2
gblip=200.200.200.1 gblport=25

```

5.1.1. PINGING, Email notification, accounting, and logging

Router A

```

set mail host=mydomain.mail.com
set ip nameserve=100.100.100.100
#
# Firewall Configuration
#
# Ping is blocked by default, to enable outgoing ping responses back in
enable firewall policy=main icmp_forward=ping
enable firewall policy="main" accounting
enable firewall policy="main" log=indenry
enable firewall notify=port,manager,mail port=0 to=it\_manager@support.co.ju
# Or if no Name server defined
enable firewall notify=port,manager,mail port=0 to=it\_manager@\[192.168.10.2\]

```

5.1.2. Internet Access to Firewall Router

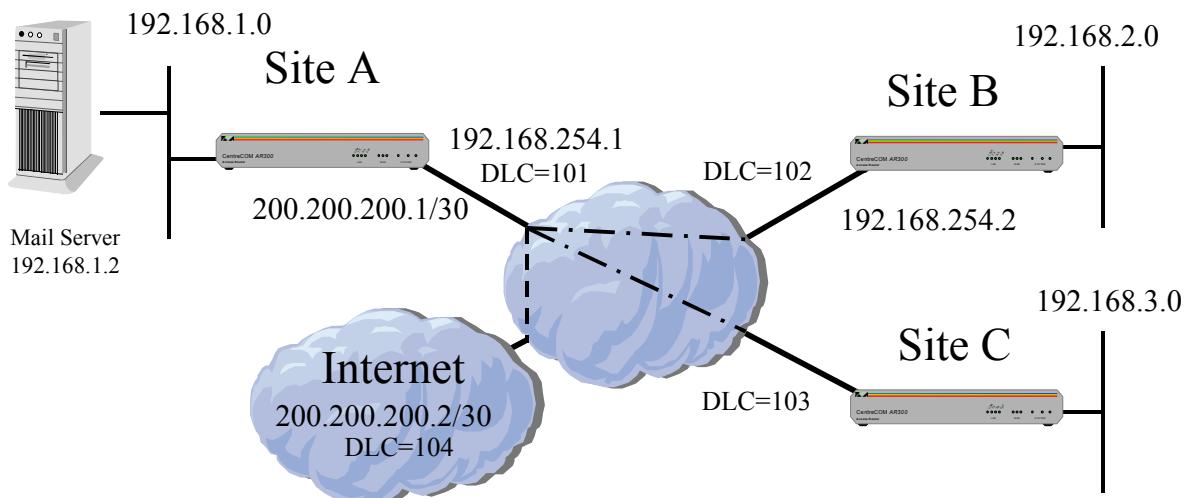

Router A:

```

#
#Firewall
# Note. Always include a remote user ip address to maintain relatively secure access
add firewall poli="main" ru=2 ac=allo int=ppp0 prot=tcp po=23 ip=192.168.10.1
gblip=200.200.200.1 gblport=23 rem=<remote manager ip address>

```

5.2. Private Frame Relay with Firewall on ISP Internet PVC

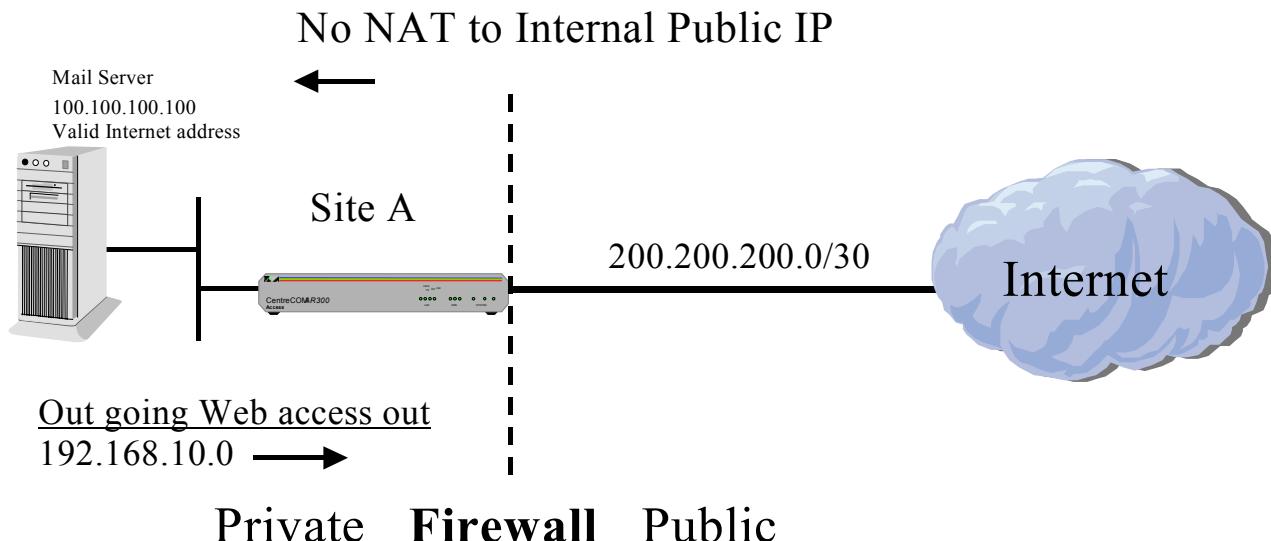

Router A

```
#  
# Frame Relay Configuration  
# Note: By default LMI is set to "LMIrev1" which is the same as "cisco" LMI type.  
create fr=0 over=syn0  
add fr=0 li=1 type=ptp  
add fr=0 li=2  
set fr=0 dlc=102 li=2  
set fr=0 dlc=103 li=2  
set fr=0 dlc=104 li=1  
#  
# IP Configuration  
#  
enable ip  
add ip int=fr0.2 ip=192.168.254.1  
add ip int=fr0.1 ip=200.200.200.1 mask=255.255.255.252  
add ip int=eth0 ip=192.168.1.1  
add ip route=0.0.0.0 next=0.0.0.0 mask=0.0.0.0 int=fr0.1 dlc=104  
add ip route=192.168.2.0 next=192.168.254.2 mask=255.255.255.0 int=fr0.2 dlc=102  
add ip route=192.168.3.0 next=192.168.254.3 mask=255.255.255.0 int=fr0.2 dlc=103  
#  
# Firewall Configuration  
# To enable out going ping see example 5.1.1  
enable firewall  
enable firewall notify=port,manager port=0  
create firewall policy="main"  
add firewall policy="main" int=eth0 type=private  
add firewall policy="main" int=fr0.2 type=private  
add firewall policy="main" int=fr0.1 type=public  
add firewall poli="main" nat=enhanced int=eth0 gblin=fr0.1 gblip=200.200.200.1  
add firewall poli="main" nat=enhanced int=fr0.2 gblin=fr0.1 gblip=200.200.200.1  
add firewall poli="main" ru=1 ac=allo int=fr0.1 prot=tcp po=25 ip=192.168.1.2  
gblip=200.200.200.1 gblport=25
```

Router B and C would be configured without Logical interfaces as in example 4.1 with a default route

5.3. Firewall over PPP with a Public and private IP range multi-homed on the LAN (Pseudo DMZ)

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP Echo Request and Echo Reply messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

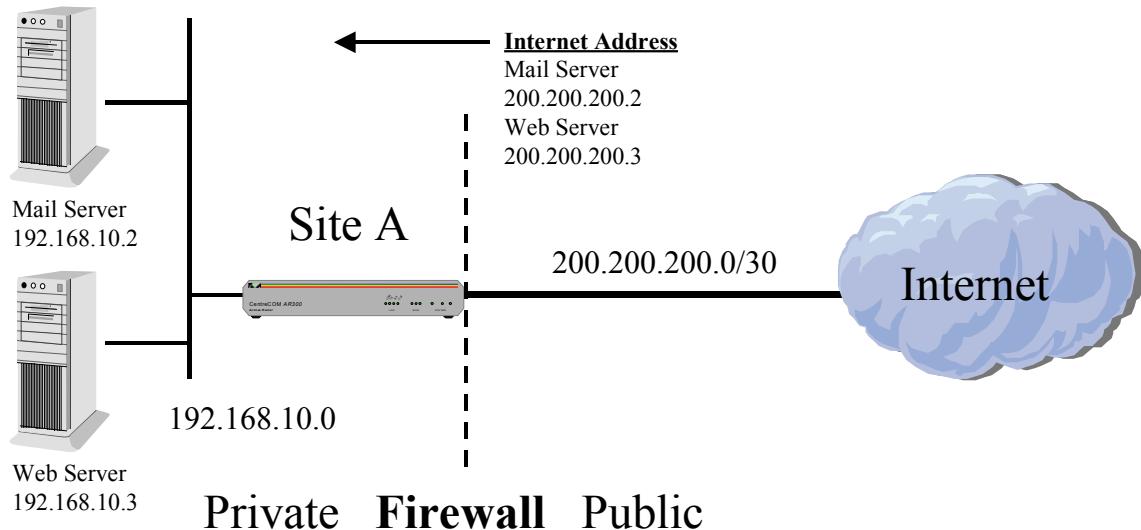

Router A

```

#
# PPP Configuration
#
create ppp=0 over=syn0
#
# IP Configuration
#
enable ip
add ip int=ppp0 ip=200.200.200.1 mask=255.255.255.252
add ip int=eth0-0 ip=192.168.10.1
add ip int=eth0-1 ip=100.100.100.97 mask=255.255.255.240
add ip route=0.0.0.0 next=0.0.0.0 mask=0.0.0.0 int=ppp0
#
# Firewall Configuration
# To enable out going ping see example 5.1.1
enable firewall
enable firewall notify=port,manager port=0
create firewall policy="main"
add firewall policy="main" int=eth0-0 type=private
add firewall policy="main" int=eth0-1 type=private
add firewall policy="main" int=ppp0 type=public
add firewall poli="main" nat=enhanced int=eth0-0 gblin=ppp0 gblip=200.200.200.1
# Allow rules required for access to servers on private 'virtual DMZ' interface
add firewall poli="main" ru=1 ac=allo int=ppp0 prot=tcp po=25 ip=100.100.100.100

```

5.4. Firewall over PPP with Private IP addresses only on the LAN

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP *Echo Request* and *Echo Reply* messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

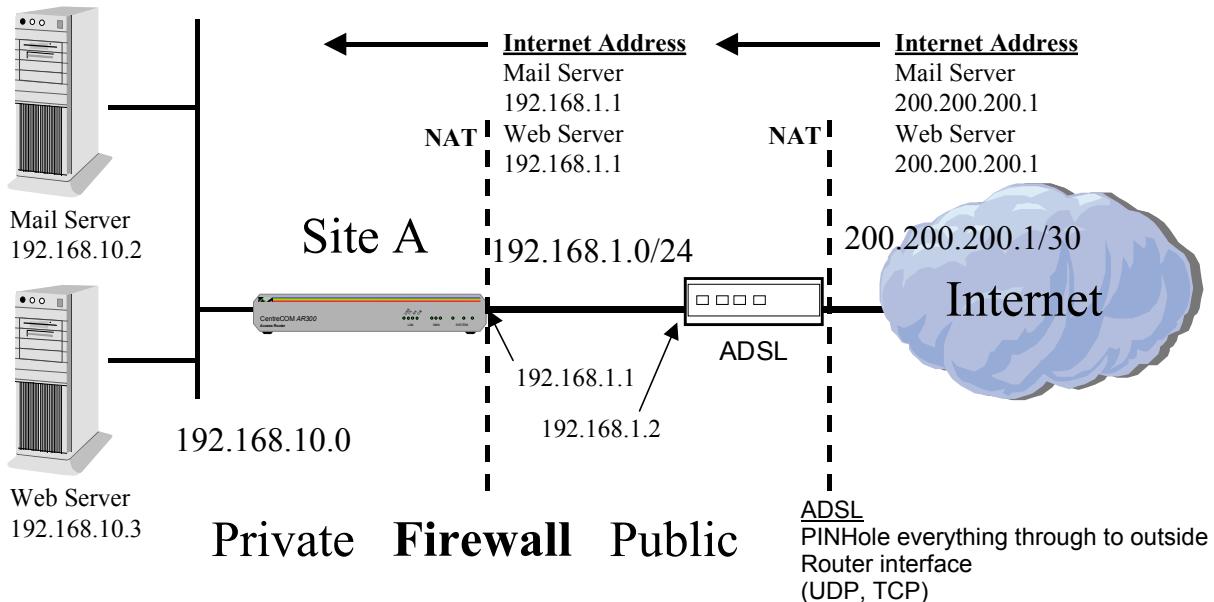

Router A

```

#
# PPP Configuration
#
create ppp=0 over=syn0
#
# IP Configuration
#
enable ip
add ip int=ppp0 ip=200.200.200.1 mask=255.255.255.252
add ip int=eth0 ip=192.168.10.1
add ip route=0.0.0.0 next=0.0.0.0 mask=0.0.0.0 int=ppp0
#
# Firewall Configuration
# To enable outgoing ping see example 5.1.1
enable firewall
enable firewall notify=port,manager port=0
create firewall policy="main"
add firewall policy="main" int=eth0 type=private
add firewall policy="main" int=ppp0 type=public
add firewall poli="main" nat=enforced int=eth0 gblin=ppp0 gblip=200.200.200.1-200.200.200.3
add firewall poli="main" ru=1 ac=allo int=ppp0 prot=tcp po=25 ip=192.168.10.2 g
bblip=200.200.200.2 gblp=25
add firewall poli="main" ru=2 ac=allo int=ppp0 prot=tcp po=80 ip=192.168.10.3 g
bblip=200.200.200.3 gblp=80

```

5.5. Firewall with ADSL

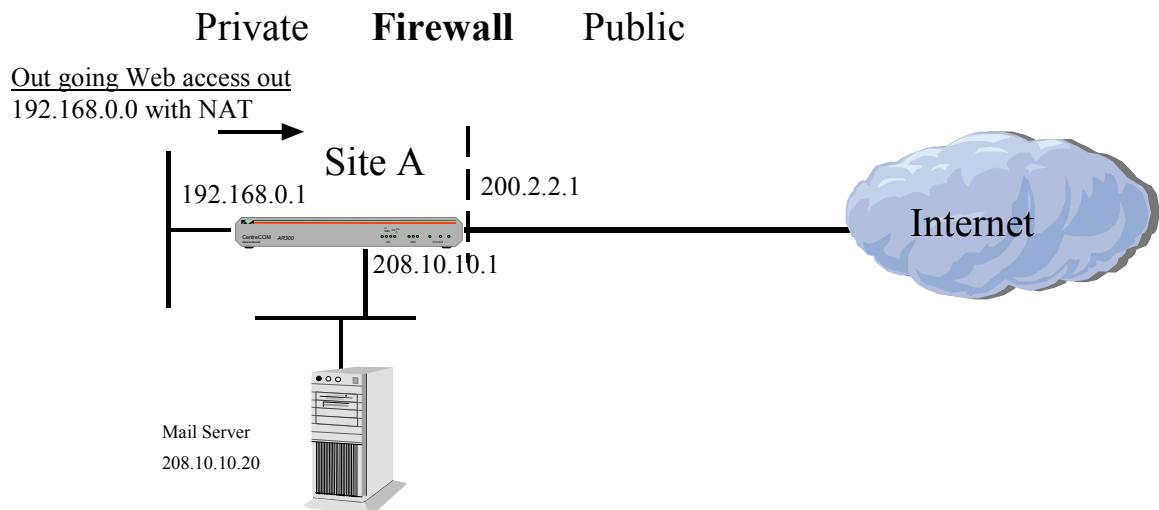

Router A

```

#
# IP Configuration
#
enable ip
add ip int=eth1 ip=192.168.1.1
add ip int=eth0 ip=192.168.10.1
add ip route=0.0.0.0 next=192.168.1.2 mask=0.0.0.0 int=eth1
#
# Firewall Configuration
# To enable out going ping see example 5.1.1
enable firewall
enable firewall notify=port,manager port=0
create firewall policy="main"
add firewall policy="main" int=eth0 type=private
add firewall policy="main" int=eth1 type=public
add firewall poli="main" nat=enforced int=eth0 gblin=eth1 gblip=192.168.1.1
add firewall poli="main" ru=1 ac=allo int=eth1 prot=tcp po=25 ip=192.168.10.2 g
bip=192.168.1.1 gblp=25
add firewall poli="main" ru=2 ac=allo int=eth1 prot=tcp po=80 ip=192.168.10.3 g
bip=192.168.1.1 gblp=80

```

5.6. Firewall over PPP with a DMZ LAN

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP Echo Request and Echo Reply messages to determine link quality (echo=on). Simply add 'lqr-off echo=on' to the PPP creation command.

Router A

```

create ppp=0 over=syn0

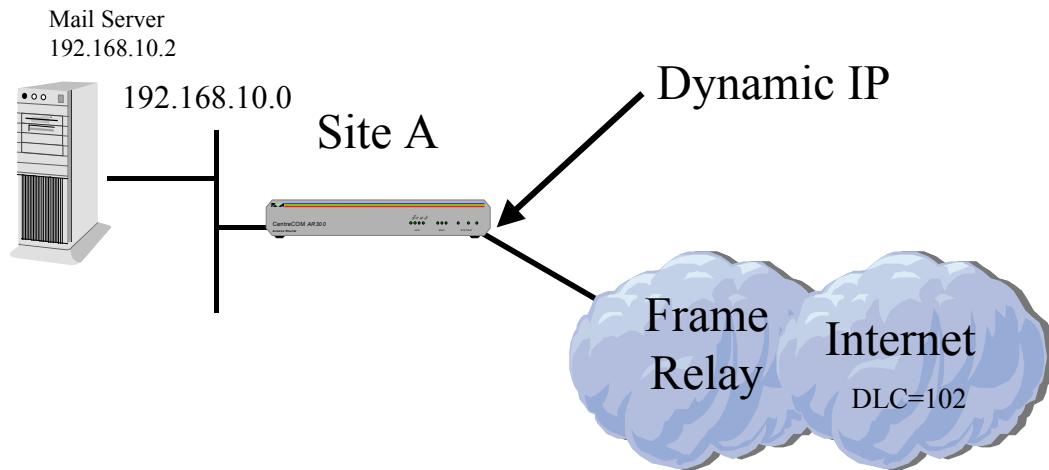

enable ip
add ip int=eth0 ip=192.168.0.1
add ip int=eth1 ip=208.10.10.1
add ip int=ppp0 ip=200.2.2.1
add ip rou=0.0.0.0 mask=0.0.0.0 int=ppp0 next=0.0.0.0

enable firewall
create firewall policy="LAN"
enable firewall policy="LAN" icmp_f=ping
add firewall policy="LAN" int=eth0 type=private
add firewall policy="LAN" int=ppp0 type=public
add firewall policy="LAN" int=eth1 type=public
add firewall poli="LAN" nat=enforced int=eth0 gblin=ppp0 gblip=208.10.10.1

create firewall policy="DMZ"
enable firewall policy="DMZ" icmp_f=ping
add firewall policy="DMZ" int=eth1 type=private
add firewall policy="DMZ" int=ppp0 type=public
add firewall policy="DMZ" int=eth0 type=public
# Allow access from Internet to Web server (domain registered 208.10.10.20)
add firewall poli="DMZ" ru=1 ac=allo int=ppp0 prot=tcp po=80 ip=208.10.10.20
# Allow any access to DMZ from eth0 LAN
add firewall poli="DMZ" ru=2 ac=allo int=eth0 prot=ALL

```

5.7. Firewall over Frame Relay with (Dynamic IP) for Internet access. "Mailing bagging"

Router A

```

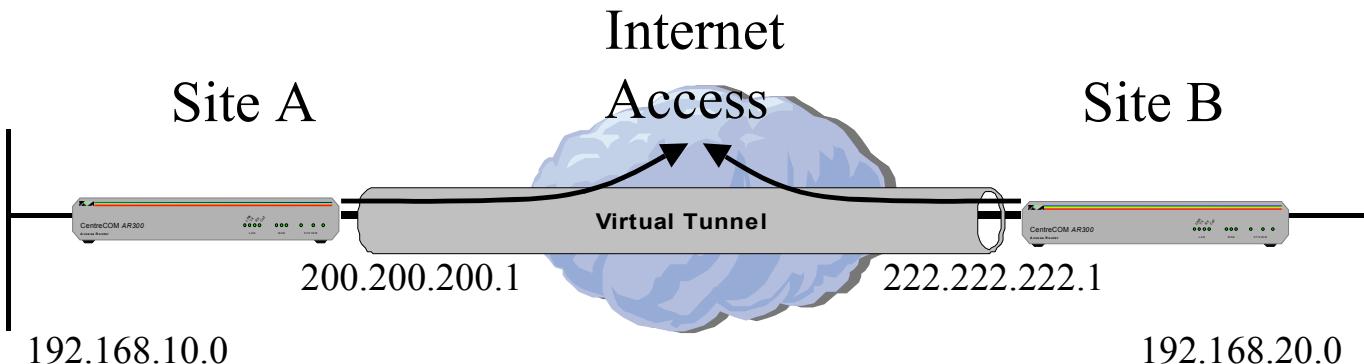

#
# Frame Relay Configuration
#
create fr=0 over=syn0 lmi=annexd
#
# IP Configuration
#
enable ip
add ip int=fr0 ip=0.0.0.0 mask=255.255.255.252
add ip int=eth0 ip=192.168.10.1
add ip route=0.0.0.0 next=0.0.0.0 mask=0.0.0.0 int=fr0 dlc=102
#
# Firewall Configuration
#
# To enable out going ping see example 5.1.1
enable firewall
enable firewall notify=port,manager port=0
create firewall policy="main"
add firewall policy="main" int=eth0 type=private
add firewall policy="main" int=fr0 type=public
add firewall poli="main" nat=enforced int=eth0 gblint=fr0
add firewall poli="main" ru=1 ac=allo int=fr0 prot=tcp po=25 ip=192.168.10.2
gblip=0.0.0.0 gblport=25

```

6. VPN

6.1. GRE Tunnel (with SA Encrypt.), NAT, and Internet

(Preferred example uses L2TP with firewall. Refer example 6.2)

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP *Echo Request* and *Echo Reply* messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

Router A (Router B, reverse IP addresses as per diagram above)

```
# ppp configuration
#
create ppp=0 over=syn0

# SA configuration
#Note: Use Section 1.5 to enable system security and generate an Encryption Key of type DES on router
#A and B

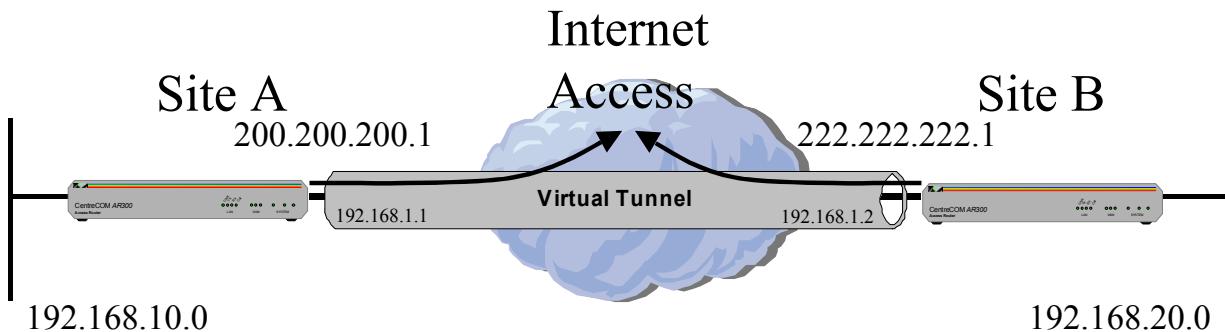

create sa=1 spi=999 enckey1=1
add sa=1 member=local ip=200.200.200.1 mask=255.255.255.255
add sa=1 member=remote ip=222.222.222.1 mask=255.255.255.255

#
# GRE
#
enable gre
add gre=1 sour=192.168.10.0 smask=255.255.255.0 dest=192.168.20.0 dmask=255.255.255.0
target=222.222.222.1

#
# IP
#Note: NAT must be on for this configuration to work correctly

enable ip
Add ip int=eth0 ip=192.168.10.1 mask=255.255.255.0
Add ip int=ppp0 ip=200.200.200.1
add ip rou=0.0.0.0 next=0.0.0.0 int=ppp0
set ip int=eth0 gre=1
add ip sa=1 int=ppp0
enable ip nat
enable ip nat log=all
add ip nat ip=192.168.10.0 mask=255.255.255.0 gblip=200.200.200.1
```

6.2. L2TP Tunnel (with SA Encrypt.), Firewall and Internet

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP Echo Request and Echo Reply messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

Router A (Router B, reverse IP addresses as per diagram above)

```

#
# L2TP Configuration
enable l2tp
enable l2tp server=both
add l2tp call="tunnel" rem="tunnel" ip=222.222.222.1 ty=virtual prec=in
set l2tp call="tunnel" pass=secret
set l2tp pass=secret

#
# ppp configuration
# Note: Tunnel is PPP10
create ppp=0 over=syn0
create ppp=10 over=tnl-tunnel idle=999999999

# SA configuration
#Note: Use Section 1.5 to enable system security and generate an Encryption Key of type DES on router
#A and B
create sa=1 spi=999 enckey1=1
add sa=1 member=local ip=192.168.10.0 mask=255.255.255.0
add sa=1 member=remote ip=192.168.20.0 mask=255.255.255.0

#
# IP
#

enable ip
Add ip int=eth0 ip=192.168.10.1 mask=255.255.255.0

add fire poli=main ru=1 int=ppp0 action=allow ip=200.200.200.1 proto=udp port=1701
set fire poli=main ru=1 gblip=200.200.200.1 gblp=1701 remoteip=222.222.222.1

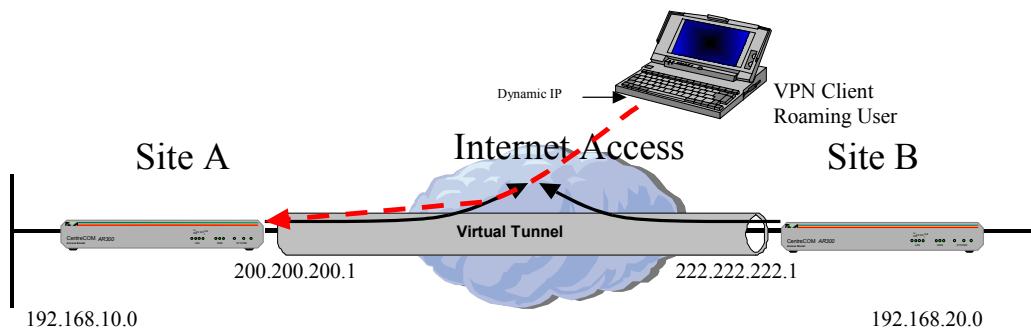

```

6.3. IPSec (with ISAKMP), Firewall, and VPN Client

This configuration illustrates two IPSec tunnels, allowing for a remote office, a remote VPN client (roaming user), and Internet access. The VPN client may use dynamic ip address. This example is not suitable behind a NATing device (eg: ADSL).

Pre-2.0.2 Release: The ISAKMP protocol can only be used simultaneously with Firewall NAT if L2TP is employed between tunnelling routers. See Example 6.5

2.0.2 Release onwards: The ISAKMP protocol may be used simultaneously with Firewall NAT with the introduction of the Firewall "nonat" action shown in this example.

Router A

```

set user securedelay=600

create ips pol=internet int=dialup act=permit

```

6.4. IPSec (with Manual Key) and Firewall with NAT device (eg: ADSL), plus VPN Client

This configuration illustrates two IPSec tunnels, allowing for a remote office, a remote VPN client (roaming user), and Internet access. In this example the VPN client must use a static address. (This is because router at Site A is behind a NATing device (ADSL modem), which therefore necessitated a manual key configuration, which in turn requires a peer with static address).

Note: Use the Manual Key option to get through a NATing device (eg: ADSL) between routers, **or use example 6.5 (L2TP)**. If passing through a NAT device (eg: ADSL) the VPN Client (Dialup user) must have a fixed IP address. A future release of the IPSec client will provide a solution to this restriction.

Router A

```

set user securedelay=600
add user=sec off pass=<your password> priv=sec

6.5. IPSec & ISAKMP (with L2TP) and Firewall router, behind NAT device (eg:ADSL)

This configuration illustrates an IPSec tunnel over L2TP to a remote office, and allows for Internet access.

Note: This solution uses Firewall with NAT and IPSec, supported from release 1.9.3. L2TP is used to Tunnel ISAKMP/IPSec through NAT process between routers (eg: ADSL). [This is NOT an IPSec client solution.](#)

Note: Be aware that with many Internet Providers it may be more suitable to turn LQR (link quality reporting) off on PPP links, and instead use LCP Echo Request and Echo Reply messages to determine link quality (echo=on). Simply add 'lqr=off echo=on' to the PPP creation command.

Router A

6.6. IPSec and Firewall through two NAT gateways (eg: ADSL)

This configuration illustrates an IPSec tunnel through two NATing devices (eg: NATing ADSL gateway devices). It uses release 2.2.1, which allows ISAKMP through NATing devices without the need of L2TP, because of the introduction of the 'localid' and 'remoteid' parameters. It also allows for Internet access.

A future version of this example will also accommodate VPN clients, using a new release version of the VPN client.

Router A

```

6.7. Two Gateways; Firewall with IPSec and ISAKMP to VPN Client & Remote Office

This example is intended for networks where there is an existing default gateway (behind a 'dirty LAN') which needs to remain in service. An Allied Telesyn router is introduced as an alternative gateway, intended only for providing the IPSec VPN tunnels.

The new VPN Gateway Router defines the default gateway router as a static RIP neighbour to advertise a route to the dynamic address of the roaming VPN client.

Router A (Allied Telesyn VPN Gateway router)

```

set system name="VPN Gateway"

set user securedelay=600
add user=secoff pass=<your password> priv=sec
add user=boblogin pass=bobpass
add user=remoffice pass=remoffice

enable ip
add ip int=eth1 ip=200.200.200.13 mask=255.255.255.240
add ip int=eth0 ip=192.168.10.1
add ip rou=0.0.0.0 mask=0.0.0.0 int=eth1 next=200.200.200.14
add ip route template=vpnclient int=eth1 next=200.200.200.14
# RIP is used to advertise a host specific route of the VPN client to the default gateway
add ip rip int=eth0 ip=192.168.10.254 send=rip2

enable firewall
create firewall policy=main
add firewall policy=main int=eth0 type=private
add firewall policy=main int=eth1 type=public
add firewall poli=main nat=enhanced int=eth0 gblin=eth1
add firewall poli=main ru=1 ac=allo int=eth1 prot=udp po=500 ip=200.200.200.13
gblip=200.200.200.13 gblpo=500

6.8. Notes on IPSec Testing and Verification

Testing of an IPSec tunnel.

The following are precautions to testing through IPSec tunnels:

- The ‘ip local’ ip address is best left at default. If ‘ip local’ is set to an address other default, this may invalidate ISAKMP negotiation.
- Do not expect to test sending traffic through the IPSec tunnel by pinging from IPSec router to IPSec router. You must test between hosts or servers behind the IPSec router gateways (LAN to LAN), to ensure this traffic will match the IPSec tunnel policy address selectors.

Verification of an IPSec tunnel.

It is good practice to confirm that traffic is being encrypted. A good initial check is to observe the ISAKMP negotiation entries in the system log ('sh log'). This ISAKMP check is only valid if you are using ISAKMP (ie: not manual keys). There will be several phases of negotiation, and they should indicate successful completion. If you can see no negotiation entries in the log, or if you only see an initial start and no completed phases, then this suggests a configuration error, or no ISAKMP negotiation received from the peer. Checking 'sh fire event' will allow you to see what traffic has been received from the peer, and if it has been allowed by the firewall.

Confirmation that traffic is actually being encrypted is best seen by using a counter command such as SH IPSEC POLI=TUNNEL COUNT. Every time you ping a set of 5 pings, the “outProcessDone” counters (in the Outbound Packet Processing Counters section) should increment by 5. Also, the echo reply traffic should cause the “inProcessDone” counters (in the Inbound Packet Processing Counters section) to increment by 5.

It is important that the IPSec policies be configured in the correct order.

If you have a “permit” IPSec Policy with open policy address selectors, (intended to allow unencrypted Internet access), then this policy must be configured last – after the ACTION=IPSEC POLICIES. Otherwise this Permit Policy will process all traffic and no traffic will be encrypted. The order of the IPSec policies can be checked by the SH IPSEC POLI command. In the output of this command, each policy is assigned a position number.

Troubleshooting of an IPSec tunnel.

If problems continue, then ISAKMP and IPSec debugging modes may be used. Turning on all debug modes is rather verbose, so we recommend basic ISAKMP debugging initially. The routine below also illustrates a method to easily disable the debugging mode after testing.

- ‘dis isakmp debug=all’ (This may give an error, but our intention is to have this command in the command buffer)
- ‘ena isakmp debug=state’ (This should allow you to see if ISAKMP is operating)
- If more detail is needed then issue this command ‘ena isakmp debug=trace’
- To disable debugging after your test, simply press up arrow once (or twice) to recall the disable command, then press enter. (VT-100 arrows may need to be enabled).

If the basic ISAKMP debugging modes do not reveal a problem to you, then all debugging modes should be enabled and captured to a text file and sent to your support centre. Please capture the debugging output from the router attempting to initiate IPSec and ISAKMP by using ‘ena ipsec poli=tunnel debug=all’ and ‘ena isakmp debug=all’. Also capture ‘sh log’ to show ISAKMP log entries (as mentioned above), and capture ‘sh fire event’ and ‘sh debug’. Forward all this debugging to your local technical support for analysis. Your local support center also have access to advanced support centers if necessary. (Allied Telesyn offers technical assistance in partnership with our authorised distributors and resellers. For technical assistance, please contact the authorised distributor or reseller in your area). Please refer to <http://www.alliedtelesyn.co.nz/support/support.html> for a list of Authorised Distributor & Resellers.
